Sprint design

The design is divided into 3 parts

Backlog: all the tasks that have to be performed in the sprint

In progress: the tasks that are in process

Finished: the tasks that have been completed

Learning Git Flow

To share the documents we have used Git Flow

In this technician use the branch.

We are administrate the branch at this form.

 -Main= is the master branch: On this branch there are only the final versions of the video game.

- Release: this branch is used for improve the version before uploading to master.

-Developer: this branch is used for push all change and and put together the different documents created.

- feature: this branch is used for crate anything new we want these branches we will later add them to develop

Git project creation

- For now for our project we have had to create these branches

- Main

-Develop

- And all branch of feature

Administration of GitHub Project

To manage project tasks use GitHub Project.

This is more graphic and intuitive, Thanks to this tool it is easier for us to organize tasks and see their progress. and it also has many features that make it more entertaining and comfortable to use.
